

Page structure:

Making the implementation with components made it much easier to structure how the webpage would look like. So, I thought about the components I would need to implement them later.

First of all, there is the Header, then I wanted a general photo about the city, which is the one I edited with GIMP. Below the photo component I wanted some general information about Girona, so I did a general component with a video and an audio, fulfilling the two of the mandatory requirements left. The next one is the list of activities, which is formed with two components, the one for the card structure of the activity and the other one for making the list of activities. Then it goes the Cart, to see the selected activities, and finally de Footer.

HEADER
GLOBAL IMAGE
GLOBAL INFO
ACTIVITY LIST & ACTIVITY CARD
CART
FOOTER

Description of the implemented features and multimedia elements**Implemented Features:**

- Interactive Cart: users can add activities from the main list, view their selection, remove items, and see the dynamically calculated total price.
- Dynamic Component Rendering: The application uses reusable components (ActivityCard, Cart, GlobalInfo) to render content dynamically based on data arrays, ensuring scalable code.
- Responsive UI Design: The layout adapts to different screen sizes, ensuring a seamless experience on both desktop and mobile devices.

-

Multimedia Elements:

- Video integration: a video player featuring a "Walking tour of Girona" to immerse users in the city's atmosphere.
- Audio integration: an audio player allowing users to listen to the Girona FC anthem, adding local cultural context.
- Edited global image: An image edited with GIMP to create an engaging visual introduction.

Brief explanation of the development process

Initially, I thought about all the components I would like to have, then I created the “components” and “multimedia-files” folders and I did research for photos and the video about Girona. Then I implemented each component and css in descending order, from the Header to the Footer. Finally I refined the css and corrected some final details.

Instructions to local run the website

To local run the website, all you need to do is copy-paste the link in the “link.md” file that is in the same folder (it’s not here because GitHub didn’t allow me to select the link and copy it, so in order not to have to download this pdf I write it in a .md file so it’s much easier to copy).

I searched (I used AI) for a way to see the website without having to download all the code, I used “npm run deploy” and I had to add “process.env.PUBLIC_URL +” in every multimedia src in order to be able to see the images with this method. I also needed to edit the package.json adding two scripts and the homepage.
